104.56. EFU Automation Redistribution Protocol v1.1

1. Purpose and Fundamental Principle

The additional flux generated by automation (**EFU surplus**) must be systematically reintegrated into **biological and social stability mechanisms**. This mechanism is not a tax but a form of **Metabolic Stabilization** within the EFU framework.

Principle

If machines replace biological labor, the liberated energy must be redirected toward strengthening **biological homeostasis**, including education, ecological regeneration, and community resilience.

---

2. Redistribution Directions (Flux Channels)

Domain	Function	Objective
Education	Competence preservation	Maintain the **DFI (Decision Independence Index)**
Ecology	Regeneration	Offset the systemic energy demand of robotics (**S_system**)
Infrastructure	Local sovereignty	Development of analog fallback systems and local networks
Basic Research	Future EFU generation	Long-term increase in civilizational order

---

3. Operational Indicators and Thresholds

3.1 Redistribution Efficiency Ratio (VHA)

Activation rule

If:

EFU_extra > 10%

or

the **Social Stability Metric (SSM)** falls below **0.6**,

then:

VHA > 0.7

becomes mandatory.

3.2 Social Integration Index (TII)

Measures whether the **liberated human time** (as defined by the Participation Minimum) is effectively transformed into **collective social value**.

Target:

TII > 0.5

3.3 Biological Stability Metric (BSM)

Ensures that technological expansion does not overwhelm or destabilize **local ecosystems**.

---

4. Integrated Automation Architecture (Complete Block)

With Module **104.56**, the automation cycle becomes closed.
The EFU framework is now capable of auditing the **entire automation process**.

Layer	Module	Function	Primary Indicator
Physical	104.53	Energy → Work	RI (Reversibility Index)
Cognitive	104.54	Information → Decision	ASK (Data Sovereignty)
Balance	104.55	Time → Stability	ASH (Automation Stability Limit)
Closure	104.56	Surplus → Homeostasis	VHA (Redistribution Ratio)

---

5. Module Integration and Systemic Synthesis

Module **104.56** closes the technological block.

It ensures that automation produces **systemic irrigation rather than systemic depletion**—that is, a return of resources into the social and biological substrate rather than their extraction.

With this module completed, the **Robotics and Automation block (104.53–104.56)** reaches full structural maturity.

All audit criteria, indicators, and safety protocols are now defined.
