104.47. SOFTWARE IMMORTALITY (COGNITIVE LEGACY) – ENGLISH VERSION

104.47 – SOFTWARE IMMORTALITY (COGNITIVE LEGACY)

Classification: Track B / High-Resolution Human-Digital Symbiosis
Main Function: Transfer of experiential knowledge (tacit knowledge) against entropy (death/forgetting)

Version: 1.0 | 2026-03-05 | István Simor

1. PURPOSE OF THE LICENSE

The purpose of the 104.47 license is to prevent civilizational amnesia.

In folk tales, knowledge passed from father to son through oral tradition; in modern times, however, a “Fire Chief”-level systems thinking (crisis management, parasite recognition, biophysical boundary control) is lost when the biological hardware (human body) shuts down.

Key Question:
How can system-level experience be made inheritable when it is not data, but a functioning algorithm?

Answer:
The 104.47 license transforms knowledge into executable code that is understandable, modifiable, and usable at a “village workshop” level, and theoretically still functional 500 years from now.

---

2. COGNITIVE MIRRORING (DIGITAL TWIN OF WISDOM)

The license does not store data (the cloud can do that), but encodes decision-making patterns.

Three main pattern categories:

2.1 Fire Chief Logic (Cell Logic)

Question:
How do you stay operational in stimulus deprivation, chaos, information starvation?

Operation:
Automatic prioritization (O_2 → Water → Food → Shelter), anti-entropy action chains.

Coding Requirement:
Decision tree describable at pseudocode level, not dependent on external APIs or updates.

Example:

```
IF O2_level < 18% THEN RETURN "OXYGEN_EMERGENCY"
```

2.2 Gryphon Filter (600-series Parasite Recognition)

Question:
How do you cut through lies, manipulation, "Gresham-parasite" systems?

Operation:
Pattern recognition (characteristic distortions: excessive complexity, opacity, server dependency).

Coding Requirement:
Independent, locally executable algorithm, verifiable at "village level".

Example:

```
IF system_complexity > 7 AND transparency_level < 3 THEN
    parasite_score += 50
```

2.3 Veto Mechanism (Biophysical Boundary)

Question:
At which biophysical threshold must the "STOP" button be pressed?

Examples:

MROI < 0%
JIM-30 < 20%
EFU-debt > 30%

These thresholds trigger automatic veto.

Coding Requirement:
RACF/EFU-based threshold checker not modifiable by external cloud commands.

Example:

```
IF MROI < 0 THEN RETURN "VETO: Parasitic project, NOT AUTHORIZED"
```

---

3. CONNECTION TO 104.44

Dimension	104.44 (Hardware)	104.47 (Software)
Durability	Physical structures for 500 years	Code and knowledge for 500 years
Problem	Rebuild every 20 years	Obsolescence every 2–3 years
Solution	Repairable, modular construction	“Village workshop” code
Metric	JIM-30 > 80%	License compatibility

Critical flaw in modern software:
Planned obsolescence (2–3 years), server dependency, closed source code.

104.47 requirement:
Every licensed software must pass the **Fire Chief test**:

Can it run during a power outage, without internet, 50 years from now?

---

4. TECHNICAL IMPLEMENTATION

4.1 Code Architecture Requirements

```
# Example: 104.47 compatible pseudocode
# Version: 1.0 | 2026-03-05 | István Simor
# License: 104.47 Software Immortality (Perpetual use, transferable)

def fire_chief_priorities(O2_level, water_reserve, food_stock,
shelter_status):

    # PRIORITY 1: OXYGEN (IMMEDIATE DEATH, 3 MINUTES)
    if O2_level < 18:
        return "OXYGEN_EMERGENCY - Immediate intervention required (3 min
survival)"

    # PRIORITY 2: SHELTER (TEMPERATURE, 3 HOURS)
    if shelter_status == 0:
        return "SHELTER_CRITICAL - Hypothermia risk (3 hour survival)"

    # PRIORITY 3: WATER (DEHYDRATION, 3 DAYS)
    if water_reserve < 2.0:
        return "HYDRATION_CRITICAL - Find water source immediately (3 day
survival)"
```

```
    # PRIORITY 4: FOOD (STARVATION, 3 WEEKS)
    if food_stock < 2000:
        return "ENERGY_DEFICIT - Food procurement priority (3 week
survival)"

    return "STABLE_OPERATION - All basic needs secured"
```

Requirements:

• Maximum 500 lines
• Simple logic
• Standard input/output
• Full English documentation
• Runtime environment: Linux / Windows pre-2030, offline

4.2 License Verification Protocol

1. DDS Condition (Documentation Derived Score):
   All critical decision algorithms in public source code.
2. Server Independence:
   No cloud API calls.
3. Time Resilience:
   Code must be interpretable in 2100.

---

5. LEGAL AND ETHICAL FRAMEWORK

• **Perpetual Use:** Unlimited use after one-time license fee
• **Transferability:** Transferable to descendants and communities
• **Irrevocability:** Cannot be revoked by external decision
• **Common Property:** Licensed knowledge has public-good status

---

6. IMPLEMENTATION GUIDE

Step 1 – Encode Experience (Pseudocode)

Write 3–5 key decision patterns in pseudocode.

Example: Gryphon Filter (Parasite Detection)

```
def gryphon_filter(system_complexity, transparency_level,
server_dependency,
                   cost_growth_rate, documentation_quality):
```

```
    parasite_score = 0

    if system_complexity > 7:
        parasite_score += 20

    if transparency_level < 3:
        parasite_score += 30

    if server_dependency > 7:
        parasite_score += 25

    if cost_growth_rate > 20:
        parasite_score += 15

    if documentation_quality < 4:
        parasite_score += 10

    if parasite_score > 70:
        return "PARASITIC_SYSTEM"
```

Step 2 – Fire Chief Veto Mechanism

```
def fire_chief_veto(MROI, JIM_30, EFU_debt, W_irrev, SS_total):

    if MROI < 0:
        return True, "VETO: MROI < 0%"

    if JIM_30 < 20:
        return True, "VETO: JIM-30 < 20%"

    if EFU_debt > 30:
        return True, "VETO: EFU-debt > 30%"

    if W_irrev > 800:
        return True, "VETO: W_irrev > 800"

    if SS_total < 0.4:
        return True, "VETO: SS_total < 0.4"

    return False, "AUTHORIZED"
```

Step 3 – Archive and Publish

GitHub Repository Structure:

```
/fire_chief_priorities.py
/gryphon_filter.py
/fire_chief_veto.py
/README.md
/LICENSE.md
/PAPER_BACKUP.txt
```

Publication Channels:

• GitHub
• Zenodo (DOI citation)
• WordPress blog

Step 4 – “Village Workshop” Paper Version

PAPER BACKUP PROTOCOL

1. Print: A3 size, 2 copies
2. Storage: Fire Chief home + Tarr Zsuzsanna safekeeping
3. Format: Pseudocode + English explanation

Example paper version:

```
FIRE CHIEF PRIORITY ALGORITHM

IF oxygen < 18% THEN
→ OXYGEN EMERGENCY

IF water_reserve < 2 liters/day THEN
→ WATER CRITICAL

IF food < 2000 kcal/day THEN
→ ENERGY DEFICIT

OTHERWISE
→ STABLE OPERATION
```

This paper will be interpretable **500 years from now**.

---

7. FINAL STATEMENT

Goal: A Fire Chief’s death should not mean knowledge loss.

The 104.47 ensures that Homo sapiens’ collective intelligence does not fall victim to entropy.

“104.47 is not just code – it is LEGACY.
This is what remains when the Fire Chief (István) is gone.
This ensures civilizational amnesia does NOT occur.
This will still work 500 years from now – because it is SIMPLE, OFFLINE, and UNDERSTANDABLE.”
