600.69.

The Gresham–Parasite Spiral

(Metabolic Extraction and Systemic Displacement)

Status: Canonical version
Document type: Diagnostic and operational protocol
System position: 600-series

---

1. AXIOM

600.69 is a self-reinforcing entropy loop.

It activates when the “Hidden Debt” —
future embedded costs,
software lock-in,
environmental externalities —

has a higher present value than the immediate benefit offered by the technology, while remaining invisible to standard economic metrics (ROI, CAPEX, etc.).

This mechanism allows a parasitic system to appear economically “efficient”.

---

2. SPIRAL DYNAMICS

(Three Stages of Systemic Degradation)

I. “Trojan” Phase – Infiltration

The technology (e.g. closed-source “smart” grid, monoblock building system) enters under the illusion of efficiency.

Because the S-factor (dependency multiplier) is hidden, decision-makers do not perceive that maintaining the system consumes future community autonomy.

Typical markers:

- Low entry cost

- High licensing or proprietary service dependency
- External software or supply-chain lock-in

II. “Gresham” Phase – Displacement

The parasitic technology becomes dominant.

Because it appears cheaper, it drains resources away from JIM-30 compatible (locally repairable) alternatives.

Consequences:

- Local technical knowledge (workshops, engineering autonomy) declines
- Repair capacity erodes
- The system shifts into a “discard-and-replace” cycle

Typical markers:

- Sharp decline in local component quota
- Decreasing JIM-30 scores
- Increasing import dependency

III. “Jevons” Collapse – Terminal Phase

The system reaches full dependency.

When an EZ SEV 2 (conflict-zone) disruption breaks the external supply chain or remote server connection, the technology becomes instantly non-functional.

There is no fallback.

The symbiotic infrastructure was dismantled during Phase II.

Result:

- Functional collapse
- Absence of local substitution capacity
- Accelerated entropy growth

---

3. OPERATIONAL DIAGNOSTIC TABLE

(Red Flags)

Marker	Phenomenon	Alert Level
Digital Quarantine	More than 20% of core functions require online authentication	CRITICAL (AP-BLACKBOX)
Monoblock Syndrome	Main unit cannot be disassembled without destruction	HIGH (JIM-30 VETO)
Knowledge Extraction	No offline service manual in local language	MEDIUM (AP-GRES-DET)
Entropy Export	Maintenance requires global logistics chain	HIGH (AP-SINKHOLE)

Interpretation rule:

- CRITICAL → Automatic VETO review
- HIGH → Mandatory alternative local supply plan
- MEDIUM → Transparency shock (public presentation via TÉKK IV)

---

4. THE “FIRE CHIEF” CLAUSE

600.69 is not a malfunction.

600.69 is the business logic of the parasitic economic model.

Its objective is not service provision, but the sustained metabolic extraction of the host system (municipality, institution, community) toward a central dependency structure.

This is structural, not moral.

Operational Conclusion

The remedy is not prohibition.

The remedy is demonstrating physical and mathematical unsuitability through:

- TÉKK filtering
- JIM-30 minimum principle enforcement
- HMI aggregation rules

If a system passes the physical and repairability filters, it is not parasitic. If it fails, 600.69 is active.

Document Closure

600.69 – Canonical Version
Placement: Engineering Bible, 600-series
